Optical Fiber Identifiers...

Single-Hand Operation and Wide Detection Range

The FI700 Series of Optical Fiber Identifiers is the safe, economical and non-destructive way to identify active lit optical fibers. These rugged units use local detection technology, which employs a macrobend method, eliminating the need to open the fiber at the splice point for identification. All models detect continuous wave, live optical transmission and low frequency modulated tones at 270 Hz, 1 k, and 2 kHz. The presence of traffic, the direction of the transmission and modulated tones on the fiber are indicated by LEDs. In addition, the FI720 models measure the fiber's relative power and displays the reading on a two-digit, seven-segment LED. This allows for measurement of power loss through a splice or connector.

Features and Benefits

- Detection of modulated tones; 270 Hz, 1 kHz, 2 kHz
- Single-hand operation
- Light weight (7.5 oz.)
- Interchangeable head for ribbon, jacketed and coated fiber allows
- virtually any fiber to be identified
- Detects all light source and loss test set modulation frequencies
