## 5522A Multi-Product Calibrator <br> Extended specifications

## General Specifications

The following tables list the 5522A specifications. All specifications are valid after allowing a warm-up period of 30 minutes, or twice the time the 5522A has been turned off. (For example, if the 5522A has been turned off for 5 minutes, the warm-up period is 10 minutes.)
All specifications apply for the temperature and time period indicated. For temperatures outside of tcal $\pm 5^{\circ} \mathrm{C}$ (tcal is the ambient temperature when the 5522A was calibrated), the temperature coefficient as stated in the General Specifications must be applied.
The specifications also assume the Calibrator is zeroed every seven days or whenever the ambient temperature changes more than $5^{\circ} \mathrm{C}$. The tightest ohms specifications are maintained with a zero cal every 12 hours within $\pm 1^{\circ} \mathrm{C}$ of use.
Also see additional specifications later in this chapter for information on extended specifications for ac voltage and current.

| Jarmup Time ....................................................Twice the time since last warmed up, to a maximum of 30 minutes. |  |
| :---: | :---: |
| Standard Interfaces...... | ...IEEE-488 (GPIB), RS-232 |
| Temperature |  |
| Operating.................................................. $0^{\circ} \mathrm{C}$ to $50^{\circ} \mathrm{C}$ |  |
| Calibration (tcal)......................................... $15{ }^{\circ} \mathrm{C}$ to $35{ }^{\circ} \mathrm{C}$ |  |
| Storage .................... | ...$-20^{\circ}$ to $+70^{\circ} \mathrm{C}$; The DC current ranges 0 to 1.09999 A and 1.1 A to 2.99999 A are sensitive to storage temperatures above $50^{\circ} \mathrm{C}$. If the 5522A is stored above $50^{\circ} \mathrm{C}$ for greater than 30 minutes, these ranges must be re-calibrated. Otherwise, the 90 day and 1 year uncertainties of these ranges double. |
| Temperature Coefficient | .Temperature coefficient for temperatures outside tcal $\pm 5^{\circ} \mathrm{C}$ is $10 \%$ of the stated specification per ${ }^{\circ} \mathrm{C}$. |

Altitude

Output Terminal Electrical Overload Protection Provides reverse-power protection, immediate output disconnection, and/or fuse protection on the output terminals for all functions. This protection is for applied external voltages up to $\pm 300 \mathrm{~V}$ peak.
Analog Low Isolation ......................................... 20 V normal operation, 400 V peak transient
Electromagnetic Environment..........................IEC 61326-1: Controlled
Electromagnetic Compatibility.........................If used in areas with Electromagnetic fields of 1 to $3 \mathrm{~V} / \mathrm{m}$ from $0.08-1 \mathrm{GHz}$, resistance outputs have a floor adder of $0.508 \Omega$ Performance not specified above $3 \mathrm{~V} / \mathrm{m}$. This instrument may be susceptible to electro-static discharge (ESD) to the binding posts. Good static awareness practices should be followed when handling this and other pieces of electronic equipment. Additionally this instrument may be susceptible to electrical fast transients on the mains terminals. If any disturbances in operation are observed, it is recommended that the rear panel chassis ground terminal be connected to a known good earth ground with a low inductance ground strap. Note that a mains power outlet while providing a suitable ground for protection against electric shock hazard may not provide an adequate ground to properly drain away conducted rf disturbances and may in fact be the source of the disturbance. This instrument was certified for EMC performance with data I/O cables not in excess of 3 m .

## Detailed Specifications

## DC Voltage

| Range | Absolute Uncertainty, tcal $\pm 5{ }^{\circ} \mathrm{C}$ $\pm(\mathrm{ppm}$ of output $+\mu \mathrm{V})$ |  | Stability | Resolution $\mu \mathrm{V}$ | Max Burden ${ }^{[1]}$ |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  | 90 days | 1 year | 24 hours, $\pm{ }^{\circ}{ }^{\circ} \mathrm{C}$ $\pm(\mathrm{ppm}$ of output $+\mu \mathrm{V}$ ) |  |  |
| 0 to 329.9999 mV | $15+1$ | $20+1$ | 3+1 | 0.1 | $65 \Omega$ |
| 0 to 3.299999 V | $9+2$ | $11+2$ | $2+1.5$ | 1 | 10 mA |
| 0 to 32.99999 V | $10+20$ | $12+20$ | $2+15$ | 10 | 10 mA |
| 30 to 329.9999 V | $15+150$ | $18+150$ | $2.5+100$ | 100 | 5 mA |
| 100 to 1020.000 V | $15+1500$ | $18+1500$ | $3+300$ | 1000 | 5 mA |
| Auxiliary Output (dual output mode only) ${ }^{[2]}$ |  |  |  |  |  |
| 0 to 329.9999 mV | $300+350$ | $400+350$ | $30+100$ | 1 | 5 mA |
| 0.33 to 3.299999 V | $300+350$ | $400+350$ | $30+100$ | 10 | 5 mA |
| 3.3 to 7 V | $300+350$ | $400+350$ | $30+100$ | 100 | 5 mA |
| TC Simulate and Measure in Linear $10 \mu \mathrm{~V} /{ }^{\circ} \mathrm{C}$ and $1 \mathrm{mV} /{ }^{\circ} \mathrm{C}$ modes ${ }^{[3]}$ |  |  |  |  |  |
| 0 to 329.9999 mV | $40+3$ | $50+3$ | $5+2$ | 0.1 | $10 \Omega$ |

[1] Remote sensing is not provided. Output resistance is $<5 \mathrm{~m} \Omega$ for outputs $\geq 0.33 \mathrm{~V}$. The AUX output has an output resistance of $<1 \Omega$. TC simulation has an output impedance of $10 \Omega \pm 1 \Omega$.
[2] Two channels of dc voltage output are provided.
[3] TC simulating and measuring are not specified for operation in electromagnetic fields above $0.4 \mathrm{v} / \mathrm{m}$.

| Range | Noise |  |
| :--- | :---: | :---: |
|  | Bandwidth 0.1 Hz to $10 \mathrm{~Hz} \mathrm{p-p}$ <br> (tppm of output + floor) | Bandwidth 10 Hz to 10 kHz rms |
| 0 to 329.9999 mV | $0+1 \mu \mathrm{~V}$ | $6 \mu \mathrm{~V}$ |
| 0 to 3.299999 V | $0+10 \mu \mathrm{~V}$ | $60 \mu \mathrm{~V}$ |
| 0 to 32.99999 V | $0+100 \mu \mathrm{~V}$ | $600 \mu \mathrm{~V}$ |
| 30 to 329.9999 V | $10+1 \mathrm{mV}$ | 20 mV |
| 100 to 1020.000 V | $10+5 \mathrm{mV}$ | 20 mV |
| Auxiliary Output (dual output mode only) ${ }^{[1]}$ |  |  |
| 0 to 329.9999 mV | $0+5 \mu \mathrm{~V}$ | $20 \mu \mathrm{~V}$ |
| 0.33 to 3.299999 V | $0+20 \mu \mathrm{~V}$ | $200 \mu \mathrm{~V}$ |
| 3.3 to 7 V | $0+100 \mu \mathrm{~V}$ | $1000 \mu \mathrm{~V}$ |
| [1] Two channels of dc voltage output are provided. |  |  |

## DC Current

| Range | Absolute Unce $\pm$ (ppm of | $\begin{aligned} & \text { inty, tcal } \pm 5{ }^{\circ} \mathrm{C} \\ & \text { tput }+\mu A) \end{aligned}$ | Resolution | Max Compliance Voltage V | Max Inductive Load mH |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  | 90 days | 1 year |  |  |  |
| 0 to $329.999 \mu \mathrm{~A}$ | $120+0.02$ | $150+0.02$ | 1 nA | 10 | 400 |
| 0 to 3.29999 mA | $80+0.05$ | $100+0.05$ | $0.01 \mu \mathrm{~A}$ | 10 |  |
| 0 to 32.9999 mA | $80+0.25$ | $100+0.25$ | $0.1 \mu \mathrm{~A}$ | 7 |  |
| 0 to 329.999 mA | $80+2.5$ | $100+2.5$ | $1 \mu \mathrm{~A}$ | 7 |  |
| 0 to 1.09999 A | $160+40$ | $200+40$ | $10 \mu \mathrm{~A}$ | 6 |  |
| 1.1 to 2.99999 A | $300+40$ | $380+40$ | $10 \mu \mathrm{~A}$ | 6 |  |
| 0 to 10.9999 A (20 A Range) | $380+500$ | $500+500$ | $100 \mu \mathrm{~A}$ | 4 |  |
| 11 to $20.5 \mathrm{~A}^{[1]}$ | $800+750{ }^{[2]}$ | $1000+750{ }^{[2]}$ | $100 \mu \mathrm{~A}$ | 4 |  |

[1] Duty Cycle: Currents < 11 A may be provided continuously. For currents $>11 \mathrm{~A}$, see Figure 1 . The current may be provided Formula $60-\mathrm{T}-\mathrm{I}$ minutes any 60 minute period where T is the temperature in ${ }^{\circ} \mathrm{C}$ (room temperature is about $23^{\circ} \mathrm{C}$ ) and I is the output current in amperes. For example, 17 A , at $23^{\circ} \mathrm{C}$ could be provided for 60-23-17 = 20 minutes each hour. When the 5522 A is outputting currents between 5 and 11 amps for long periods, the internal self-heating reduces the duty cycle. Under those conditions, the allowable "on" time indicated by the formula and Figure 1 is achieved only after the 5522A is outputting currents <5 A for the "off" period first.
[2] Floor specification is $1500 \mu \AA$ within 30 seconds of selecting operate. For operating times $\mathbf{> 3 0}$ seconds, the floor specification is $750 \mu \mathrm{~A}$.

| Range | Noise |  |
| :--- | :---: | :---: |
|  | Bandwidth 0.1 Hz to 10 Hz p-p | Bandwidth 10 Hz to 10 kHz rms |
| 0 to $329.999 \mu \mathrm{~A}$ | 2 nA | 20 nA |
| 0 to 3.29999 mA | 20 nA | 200 nA |
| 0 to 32.9999 mA | 200 nA | $2.0 \mu A$ |
| 0 to 329.999 mA | 2000 nA | $20 \mu A$ |
| 0 to 2.99999 A | $20 \mu A$ | 1 mA |
| 0 to 20.5 A | $200 \mu A$ | 10 mA |

[1] Continuously variable from $0 \Omega \square$ to $1.1 \mathrm{G} \Omega$.
[2] Applies for 4-WIRE compensation only. For 2-WIRE and 2-WIRE COMP, add an additional amount to the floor specification as calculated by: ( $5 \mu \mathrm{~V}$ divided by the stimulus current in amps). For example, in 2 -WIRE mode, at $1 \mathrm{k} \Omega$ the floor specification within 12 hours of an ohms zero cal for a measurement current of 1 mA is: $0.002 \Omega+(5 \mu \mathrm{~V} / 1 \mathrm{~mA})=(0.002+0.005) \Omega=$ $0.007 \Omega$.
[3] For currents lower than shown, the floor adder increases by Floor(new) = Floor(old) x Imin/Iactual. For example, a $50 \mu \mathrm{~A}$ stimulus measuring $100 \Omega$ has a floor specification of: $0.0014 \Omega \times 1 \mathrm{~mA} / 50 \mu \AA=0.028 \Omega$ assuming an ohms zero calibration within 12 hours.

AC Voltage (Sine Wave)

| Range | Frequency | $\begin{aligned} & \text { Absolute Uncertainty, } \\ & \text { tcal } \pm 5{ }^{\circ} \mathrm{C} \\ & \pm(\mathrm{ppm} \text { of output }+\mu \mathrm{V}) \end{aligned}$ |  | Resolution | $\underset{\text { Marden }}{\substack{\text { Max } \\ \text { Bur }}}$ | Max Distortion and Noise <br> 10 Hz to 5 MHz Bandwidth $\pm(\%$ of output + floor) |

|  | 5 kHz to 10 kHz | $250+10000$ | $300+10000$ |  |  | $0.07+30 \mathrm{mV}$ |

[1] Max Distortion for 100 kHz to 200 kHz . For 200 kHz to 500 kHz , the maximum distortion is $0.9 \%$ of output + floor as shown.

Note
Remote sensing is not provided. Output resistance is $<5 \mathrm{~m} \Omega$ for outputs $\geq 0.33 \mathrm{~V}$. The AUX output resistance is <1 $\Omega$. The maximum load capacitance is 500 pF , subject to the maximum burden current limits

[1] There are two channels of voltage output. The maximum frequency of the dual output is 30 kHz .
Note
Remote sensing is not provided. Output resistance is $<5 \mathrm{~m} \Omega$ for outputs $\geq 0.33 \mathrm{~V}$. The AUX output resistance is $<1 \Omega$. The maximum load capacitance is 500 pF , subject to the maximum burden current limits

| [1] Duty Cycle: Currents <11 A may be provided continuously. For currents >11A, see Figure 1. The current may be provided 60 -T-I minutes any 60 minute period where T is the temperature in ${ }^{\circ} \mathrm{C}\left(\right.$ room temperature is about $23^{\circ} \mathrm{C}$ ) and I is the output current in Amps. For example, 17 A , at $23^{\circ} \mathrm{C}$ could be provided for 60-23-17 $=20$ minutes each hour. When the 5522A is outputting currents between 5 and 11 amps for long periods, the internal self-heating reduces the duty cycle. Under those conditions, the allowable "on" time indicated by the formula and Figure 1 is achieved only after the 5522A is outputting currents $<5 \mathrm{~A}$ for the "off" period first. <br> [2] For compliance voltages greater than 1 V , add $1 \mathrm{~mA} / \mathrm{V}$ to the floor specification from 1 to 5 kHz . <br> [3] For compliance voltages greater than 1 V , add $5 \mathrm{~mA} / \mathrm{V}$ to the floor specification from 5 to 10 kHz . |  |  |  |  |  |  |

[1] Duty Cycle: Currents <11A may be provided continuously. For currents >11A, see Figure 1. The current may be provided Formula $60-\mathrm{T}-\mathrm{I}$ minutes any 60 minute period where T is the temperature in ${ }^{\circ} \mathrm{C}$ (room temperature is about $23{ }^{\circ} \mathrm{C}$ ) and I is the output current in Amps. For example, 17 A , at $23^{\circ} \mathrm{C}$ could be provided for 60-23-17 = 20 minutes each hour. When the 5522A is outputting currents between 5 and 11 amps for long periods, the internal self-heating reduces the duty cycle. Under those conditions, the allowable "on" time indicated by the formula and Figure 1 is achieved only after the 5522 A is outputting currents < 5 A for the "off" period first.
[2] For currents $>11 \mathrm{~A}$, Floor specification is $4000 \mu \mathrm{~A}$ within 30 seconds of selecting operate. For operating times $>30$ seconds, the floor specification is $2000 \mu \mathrm{~A}$.
[3] For currents $>11$ A , Floor specification is $10000 \mu \mathrm{~A}$ within 30 seconds of selecting operate. For operating times $>30$ seconds, the floor specification is $5000 \mu \mathrm{~A}$.

[1] The output is continuously variable from 220 pF to 110 mF .
[2] Specifications apply to both dc charge/discharge capacitance meters and ac RCL meters. The maximum allowable peak voltage is 3 V . The maximum allowable peak current is 150 mA , with an rms limitation of 30 mA below $1.1 \mu \mathrm{~F}$ and 100 mA for $1.1 \mu \mathrm{~F}$ and above.
[3] The maximum lead resistance for no additional error in 2-wire COMP mode is $10 \Omega$.

| 10 to 30 kHz | 3.3 V to 250 V | 33 mA to 329.99 mA | 1 V to 3.29999 V | 0 to 1 |

Notes
The range of voltages and currents shown in "DC Voltage Specifications," "DC Current Specifications," "AC Voltage (Sine Wave) Specifications," and "AC Current (Sine Wave) Specifications" are available in the power and dual output modes (except minimum current for ac power is 0.33 mA ). However, only those limits shown in this table are specified. See "Calculating Power Uncertainty" to determine the uncertainty at these points.
The phase adjustment range for dual ac outputs is $0^{\circ}$ to $\pm 179.99^{\circ}$. The phase resolution for dual ac outputs is 0.01 degree.

Phase

| $90^{\circ}$ | $0^{\circ}$ | 0.000 | -- | -- | -- | -- | -- | -- |

To calculate exact ac Watts power adders due to phase uncertainty for values not shown, use the following formula:

$$
\operatorname{Adder}(\%)=100\left(1-\frac{\operatorname{Cos}(\Phi+\Delta \Phi)}{\operatorname{Cos}(\Phi)}\right)
$$

For example: At 60 Hz , for a PF of $.9205(\Phi=23)$ and a phase uncertainty of $\Delta \Phi=0.10$, the ac Watts power adder is:

$$
\operatorname{Adder}(\%)=100\left(1-\frac{\operatorname{Cos}(23+.10)}{\operatorname{Cos}(23)}\right)=0.074 \%
$$

## Calculating Power Uncertainty

Overall uncertainty for power output in Watts (or VARs) is based on the root sum square (rss) of the individual uncertainties in percent for the selected voltage, current, and power factor parameters:

Watts uncertainty $U_{\text {power }}=\sqrt{U^{2} \text { voltage }+U^{2} \text { current }+U^{2} \text { PFadder }}$
VARs uncertainty UVARs $=\sqrt{U^{2} \text { voltage }+U^{2} \text { current }+U^{2} \text { VARsadder }}$
Because there are an infinite number of combinations, you should calculate the actual ac power uncertainty for your selected parameters. The method of calculation is best shown in the following examples (using 1 year specifications):
Example 1 Output: $100 \mathrm{~V}, 1 \mathrm{~A}, 60 \mathrm{~Hz}$, Power Factor $=1.0(\Phi=0)$.
Voltage Uncertainty Uncertainty for 100 V at 60 Hz is $190 \mathrm{ppm}+2 \mathrm{mV}$, totaling: $100 \mathrm{~V} \times 190 \times 10^{-6}=19 \mathrm{mV}$ added to $2 \mathrm{mV}=21 \mathrm{mV}$. Expressed in percent: $21 \mathrm{mV} / 100 \mathrm{~V} \times 100=\underline{0.021 \%}$ (see "AC Voltage (Sine Wave) Specifications").
Current Uncertainty Uncertainty for 1 A is $0.05 \% \square 100 \mu \mathrm{~A}$, totaling:
$1 \mathrm{~A} \times 0.0005=500 \mu \mathrm{~A}$ added to $100 \mu \mathrm{~A}=0.6 \mathrm{~mA}$. Expressed in percent:
$0.6 \mathrm{~mA} / 1 \mathrm{~A} \times 100=\underline{0.06 \%}$ (see "AC Current (Sine Waves) Specifications").
PF Adder Watts Adder for PF = 1 ( $\Phi=0$ ) at 60 Hz is 0 \% (see "Phase Specifications").
Total Watts Output Uncertainty $=U_{\text {power }}=\sqrt{0.021^{2}+0.06^{2}+0^{2}}=0.064 \%$
Example 2 Output: $100 \mathrm{~V}, 1 \mathrm{~A}, 400 \mathrm{~Hz}$, Power Factor $=0.5$ ( $\Phi=60$ )
Voltage Uncertainty Uncertainty for 100 V at 400 Hz is, $190 \mathrm{ppm}+2 \mathrm{mV}$, totaling:
$100 \mathrm{~V} \times 190 \times 10^{-6}=19 \mathrm{mV}$ added to $2 \mathrm{mV}=21 \mathrm{mV}$. Expressed in percent:
$21 \mathrm{mV} / 100 \mathrm{~V} \times 100=0.021$ \% (see "AC Voltage (Sine Wave) Specifications").
Current Uncertainty Uncertainty for 1 A is $0.05 \% \square 100 \mu \mathrm{~A}$, totaling:
$1 \mathrm{~A} \times 0.0005=500 \mu \mathrm{~A}$ added to $100 \mu \mathrm{~A}=0.6 \mathrm{~mA}$. Expressed in percent:
$0.6 \mathrm{~mA} / 1 \mathrm{~A} \times 100=\underline{0.06 \%}$ (see "AC Current (Sine Waves) Specifications").
PF Adder Watts Adder for PF $=0.5(\Phi=60)$ at 400 Hz is $0.76 \%$ (see "Phase Specifications").

Total Watts Output Uncertainty $=\mathrm{U}_{\text {power }}=\sqrt{0.021^{2}+0.06^{2}+0.76^{2}}=0.76 \%$
VARs When the Power Factor approaches 0.0, the Watts output uncertainty becomes unrealistic because the dominant characteristic is the VARs (volts-amps-reactive) output. In these cases, calculate the Total VARs Output Uncertainty, as shown in example 3:
Example 3 Output: $100 \mathrm{~V}, 1 \mathrm{~A}, 60 \mathrm{~Hz}$, Power Factor $=0.174$ ( $\Phi=80$ )
Voltage Uncertainty Uncertainty for 100 V at 60 Hz is, $190 \mathrm{ppm}+2 \mathrm{mV}$, totaling:
$100 \mathrm{~V} \times 190 \times 10^{-6}=19 \mathrm{mV}$ added to $2 \mathrm{mV}=21 \mathrm{mV}$. Expressed in percent:
$21 \mathrm{mV} / 100 \mathrm{~V} \times 100=\underline{0.021 \%}$ (see "AC Voltage (Sine Wave) Specifications").
Current Uncertainty Uncertainty for 1 A is $0.05 \% \square 100 \mu \mathrm{~A}$, totaling:
$1 \mathrm{~A} \times 0.0005=500 \mu \mathrm{~A}$ added to $100 \mu \mathrm{~A}=0.6 \mathrm{~mA}$. Expressed in percent:
$0.6 \mathrm{~mA} / 1 \mathrm{~A} \times 100=0.06 \%$ (see "AC Current (Sine Waves) Specifications").
VARs Adder VARs Adder for $\Phi=80$ at 60 Hz is $\underline{0.03 \%}$ (see "Phase Specifications").
Total VARS Output Uncertainty $=U_{\text {vARs }}=\sqrt{0.021^{2}+0.06^{2}+0.03^{2}}=0.070 \%$

## Additional Specifications

The following paragraphs provide additional specifications for the 5522A Calibrator ac voltage and ac current functions. These specifications are valid after allowing a warm-up period of 30 minutes, or twice the time the 5522A has been turned off. All extended range specifications are based on performing the internal zero-cal function at weekly intervals, or when the ambient temperature changes by more than $5^{\circ} \mathrm{C}$.

## Frequency

| Frequency Range | Resolution | 1-Year Absolute Uncertainty, <br> tcal $\pm 5{ }^{\circ} \mathrm{C}$ | Jitter |
| :---: | :---: | :---: | :---: |
| 0.01 to 119.99 Hz | 0.01 Hz |  |  |
| 120.0 to 1199.9 Hz | 0.1 Hz |  |  |
| 1.200 to 11.999 kHz | 1.0 Hz | $2.5 \mathrm{ppm}+5 \mu \mathrm{~Hz}^{[1]}$ | 100 ns |
| 12.00 to 119.99 kHz | 10 Hz |  |  |
| 120.0 to 1199.9 kHz | 100 Hz |  |  |
| 1.200 to 2.000 MHz | 1 kHz |  |  |

[1] With REF CLK set to ext, the frequency uncertainty of the 5522A is the uncertainty of the external 10 MHz clock $\pm 5 \mu \mathrm{~Hz}$. The amplitude of the 10 MHz external reference clock signal should be between 1 V and 5 V p-p.

## Harmonics ( $\mathbf{2}^{\text {nd }}$ to $\mathbf{5 0}^{\text {th }}$ )

| Fundamental Frequency ${ }^{[1]}$ | Voltages NORMAL Terminals | Currents | Voltages AUX Terminals | Amplitude Uncertainty |
| :---: | :---: | :---: | :---: | :---: |
| 10 to 45 Hz | 33 mV to 32.9999 V | 3.3 mA to 2.99999 A | 10 mV to 5 V | Same \% of output as the equivalent single output, but twice the floor adder. |
| 45 to 65 Hz | 33 mV to 1020 V | 3.3 mA to 20.5 A | 10 mV to 5 V |  |
| 65 to 500 Hz | 33 mV to 1020 V | 33 mA to 20.5 A | 100 mV to 5 V |  |
| 500 Hz to 5 kHz | 330 mV to 1020 V | 33 mA to 20.5 A | 100 mV to 5 V |  |
| 5 to 10 kHz | 3.3 to 1020 V | $\begin{gathered} 33 \mathrm{to} \\ 329.9999 \mathrm{~mA} \end{gathered}$ | 100 mV to 5 V |  |
| 10 to 30 kHz | 3.3 to 1020 V | $\begin{array}{r} 33 \mathrm{to} \\ 329.9999 \mathrm{~mA} \\ \hline \end{array}$ | $\begin{array}{r} 100 \mathrm{mV} \text { to } \\ 3.29999 \mathrm{~V} \end{array}$ |  |

[1] The maximum frequency of the harmonic output is 30 kHz ( 10 kHz for 3.3 to 5 V on the Aux terminals). For example, if the fundamental output is 5 kHz , the maximum selection is the 6th harmonic ( 30 kHz ). All harmonic frequencies (2nd to 50 th) are available for fundamental outputs between 10 Hz and $600 \mathrm{~Hz}(200 \mathrm{~Hz}$ for 3.3 to 5 V on the Aux terminals).

Phase uncertainty for harmonic outputs is 1 degree or the phase uncertainty shown in "Phase Specifications" for the particular output, whichever is greater. For example, the phase uncertainty of a 400 Hz fundamental output and 10 kHz harmonic output is $5^{\circ}$ (from "Phase Specifications"). Another example, the phase uncertainty of a 50 Hz fundamental output and a 400 Hz harmonic output is 1 degree.

Example of determining Amplitude Uncertainty in a Dual Output Harmonic Mode
What are the amplitude uncertainties for the following dual outputs?

| NORMAL (Fundamental) Output: |  |
| :---: | :---: |
| $100 \mathrm{~V}, 100 \mathrm{~Hz}$ | From "AC Voltage (Sine Wave) 90 Day Specifications" the single output specification for $100 \mathrm{~V}, 100 \mathrm{~Hz}$, is $0.015 \%+2 \mathrm{mV}$. For the dual output in this example, the specification is $0.015 \%+4 \mathrm{mV}$ as the $0.015 \%$ is the same, and the floor is twice the value ( 2 x 2 mV ). |
| AUX (50th Harmonic) Output: |  |
| $100 \mathrm{mV}, 5 \mathrm{kHz}$ | From "AC Voltage (Sine Wave) 90 Day Specifications" the auxiliary output specification for $100 \mathrm{mV}, 5 \mathrm{kHz}$, is $0.15 \%+450 \mathrm{mV}$. For the dual output in this example, the specification is $0.15 \%$ 900 mV as the $0.15 \%$ is the same, and the floor is twice the value ( $2 \times 450 \mathrm{mV}$ ). |

## AC Voltage (Sine Wave) Extended Bandwidth

| Range | Frequency | 1-Year Absolute Uncertainty tcal $\pm 5^{\circ} \mathrm{C}$ | Max Voltage Resolution |
| :---: | :---: | :---: | :---: |
| Normal Channel (Single Output Mode) |  |  |  |
| 1.0 to 33 mV | 0.01 to 9.99 Hz | $\pm(5.0 \%$ of output <br> $+0.5 \%$ of range) | Two digits, e.g., 25 mV |
| 34 to 330 mV |  |  | Three digits |
| 0.4 to 33 V |  |  | Two digits |
| 0.3 to 3.3 V | 500.1 kHz to 1 MHz | -10 dB at 1 MHz , typical | Two digits |
|  | 1.001 to 2 MHz | -31 dB at 2 MHz , typical |  |
| Auxiliary Output (Dual Output Mode) |  |  |  |
| 10 to 330 mV | 0.01 to 9.99 Hz | $\pm(5.0 \%$ of output <br> $+0.5 \%$ of range) | Three digits |
| 0.4 to 5 V |  |  | Two digits |

## AC Voltage (Non-Sine Wave)

| Triangle Wave \& Truncated Sine Range, p -p | Frequency | $\begin{gathered} \text { 1-Year Absolute Uncertainty, } \\ \text { tcal } \pm 5{ }^{\circ} \mathrm{C}, \\ \pm\left(\% \text { of output }+\% \text { of range) }{ }^{[2]}\right. \end{gathered}$ | Max Voltage Resolution |
| :---: | :---: | :---: | :---: |
| Normal Channel (Single Output Mode) |  |  |  |
| 2.9 to 92.999 mV | 0.01 to 10 Hz | $5.0+0.5$ | Two digits on each range |
|  | 10 to 45 Hz | $0.25+0.5$ | Six digits on each range |
|  | 45 Hz to 1 kHz | $0.25+0.25$ |  |
|  | 1 to 20 kHz | $0.5+0.25$ |  |
|  | 20 to $100 \mathrm{kHz}^{[3]}$ | $5.0+0.5$ |  |
| 93 to 929.999 mV | 0.01 to 10 Hz | $5.0+0.5$ | Two digits on each range |

|  | 45 Hz to 1 kHz | $0.25+0.25$ |  |
|  | 1 to $10 \mathrm{kHz}{ }^{[3]}$ | $5.0+0.5$ |  |
| [1] To convert p-p to rms for square wave, multiply the p-p value by 0.5 . <br> [2] Uncertainty is stated in p-p. Amplitude is verified using an rms-responding DMM. <br> [3] Limited to 1 kHz for Auxiliary outputs $\geq 6.6 \mathrm{~V}$ p-p. |  |  |  |

## AC Voltage, DC Offset

| Range ${ }^{[1]}$ (Normal Channel) | Offset Range ${ }^{[2]}$ | Max Peak Signal | $\begin{gathered} 1 \text {-Year Absolute Uncertainty, } \\ \text { tcall } \pm 5{ }^{\circ}{ }^{[3]} \\ \pm(\% \text { of dc output + floor) } \\ \hline \end{gathered}$ |
| :---: | :---: | :---: | :---: |
| Sine Waves (rms) |  |  |  |
| 3.3 to 32.999 mV | 0 to 50 mV | 80 mV | $0.1+33 \mu \mathrm{~V}$ |
| 33 to 329.999 mV | 0 to 500 mV | 800 mV | $0.1+330 \mu \mathrm{~V}$ |
| 0.33 to 3.299999 V | 0 to 5 V | 8 V | $0.1+3300 \mu \mathrm{~V}$ |
| 3.3 to 32.9999 V | 0 to 50 V | 55 V | $0.1+33 \mathrm{mV}$ |
| Triangle Waves and Truncated Sine Waves (p-p) |  |  |  |
| 9.3 to 92.999 mV | 0 to 50 mV | 80 mV | $0.1+93 \mu \mathrm{~V}$ |
| 93 to 929.999 mV | 0 to 500 mV | 800 mV | $0.1+930 \mu \mathrm{~V}$ |
| 0.93 to 9.29999 V | 0 to 5 V | 8 V | $0.1+9300 \mu \mathrm{~V}$ |
| 9.3 to 93.0000 V | 0 to 50 V | 55 V | $0.1+93 \mathrm{mV}$ |
| Square Waves (p-p) |  |  |  |
| 6.6 to 65.999 mV | 0 to 50 mV | 80 mV | $0.1+66 \mu \mathrm{~V}$ |
| 66 to 659.999 mV | 0 to 500 mV | 800 mV | $0.1+660 \mu \mathrm{~V}$ |
| 0.66 to 6.59999 V | 0 to 5 V | 8 V | $0.1+6600 \mu \mathrm{~V}$ |
| 6.6 to 66.0000 V | 0 to 50 V | 55 V | $0.1+66 \mathrm{mV}$ |

[1] Offsets are not allowed on ranges above the highest range shown above.
[2] The maximum offset value is determined by the difference between the peak value of the selected voltage output and the allowable maximum peak signal. For example, a 10 V p-p square wave output has a peak value of 5 V , allowing a maximum offset up to $\pm 50 \mathrm{~V}$ to not exceed the 55 V maximum peak signal. The maximum offset values shown above are for the minimum outputs in each range.
[3] For frequencies 0.01 to 10 Hz , and 500 kHz to 2 MHz , the offset uncertainty is $5 \%$ of output, $\pm 1 \%$ of the offset range.

## AC Voltage, Square Wave Characteristics

| Risetime @ <br> 1 <br> Typical | Settling Time @ <br> 1 kHz Typical | Overshoot <br> @ 1 kHz <br> Typical | Duty Cycle Range | Duty Cycle Uncertainty |
